Motivation Additive Z₂Z₄ Codes Counting codes Summary

Basic Definitions Generator Matrix Duality

[3]-[6]

 An additive Z₂Z₄ code C is a subgroup of Z^α₂Z^β₄, it is isomorphic to an abelian structure Z^γ₂Z^β₄.

•
$$|C| = 2^{\gamma} 4^{\delta}$$
.

• The number of order two vectors is $2^{\gamma+\delta}$.

Motivation Additive Z₂Z₄ Codes Counting codes Summary Duality

Example

Take *C* as a $\mathbb{Z}_2\mathbb{Z}_4$ code generated by

$$G = \left(\begin{array}{ccc|c} 1 & 0 & 0 & 1 & 0 & 2 \\ \hline 1 & 0 & 1 & 1 & 2 & 1 \end{array}\right)$$

$$C = \left\{ (0000|00), (1011|21), (0000|02), (1011|23), (1001|02), (0010|23), (1001|00), (0010|21) \right\}$$

Motivation Additive Z₂Z₄ Codes Counting codes Summary

Basic Definitions Generator Matrix Duality

[3]-[6]

- *X* and *Y* denote the set of \mathbb{Z}_2 and \mathbb{Z}_4 coordinate positions, respectively.
 - $|X| = \alpha$ and $|Y| = \beta$.
 - X corresponds to the first α coordinates and Y corresponds to the last β coordinates.
- Define C_X and C_Y .

Motivation Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes Counting codes Summary

Basic Definitions Generator Matrix Duality

[3]-[6]

- *C_b*: The subcode of *C* which contains all order two codewords
 κ: The dimension of (*C_b*)_X.
 - C_b is a binary linear code.
- When $\alpha = 0$, then $\kappa = 0$.
- We say that a $\mathbb{Z}_2\mathbb{Z}_4$ code *C* is of type $(\alpha, \beta; \gamma, \delta; \kappa)$.

Motivation Additive Z₂Z₄ Codes Counting codes Summary

Basic Definitions Generator Matrix Duality

Example

From the previous example, take *C* as a $\mathbb{Z}_2\mathbb{Z}_4$ code generated by

$$G = \left(\begin{array}{ccc|c} 1 & 0 & 0 & 1 & 0 & 2\\ \hline 1 & 0 & 1 & 1 & 2 & 1 \end{array}\right)$$

•
$$\alpha = 4, \beta = 2$$
 since $|X| = 4$ and $|Y| = 2$.

- The order of C is $2^{1}4^{1}$, hence $\gamma = 1$ and $\delta = 1$.
- The code C_b is generated by (1001|02) and (0000|21). $(C_b)_X$ is generated by (1001) and so $\kappa = 1$
- *C* is of type (4, 2, 1, 1, 1).

 Counting codes
 Summary

[3]-[6]

A $\mathbb{Z}_2\mathbb{Z}_4$ code of type $(\alpha, \beta; \gamma, \delta; \kappa)$ is permutation equivalent to a $\mathbb{Z}_2\mathbb{Z}_4$ code of type $(\alpha, \beta; \gamma, \delta; \kappa)$ with standard generator matrix of the form

$$G = egin{pmatrix} I_\kappa & T_b & 2T_2 & \mathbf{0} & \mathbf{0} \ \mathbf{0} & \mathbf{0} & 2T_1 & 2I_{\gamma-\kappa} & \mathbf{0} \ \hline \mathbf{0} & S_b & S_q & R & I_\delta \end{pmatrix},$$

where I_k is the identity matrix; T_b, T_1, T_2, R, S_b are matrices over \mathbb{Z}_2 and S_q is a matrix over \mathbb{Z}_4 .

[3]-[6]

The parameters of a $\mathbb{Z}_2\mathbb{Z}_4$ code has the following inequalities:

$$\begin{array}{rcl} \alpha,\beta,\gamma,\delta,\kappa &\geq & 0, \quad \alpha+\beta>0\\ 0<\gamma+\delta &\leq & \beta+\kappa, \quad \kappa\leq\min(\alpha,\gamma). \end{array}$$

Motivation Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes Counting codes Summary

Basic Definitions Generator Matrix Duality

Example

$$G_{1} = \begin{pmatrix} \mathbf{1} & \mathbf{0} & 2 & 0 & 0 \\ \mathbf{0} & \mathbf{1} & 2 & 0 & 0 \\ 0 & 0 & 2 & \mathbf{2} & 0 \\ \hline \mathbf{0} & \mathbf{0} & 3 & 1 & \mathbf{1} \end{pmatrix} G_{2} = \begin{pmatrix} \mathbf{1} & 2 & 0 & 0 & 0 & 0 \\ 0 & 0 & \mathbf{2} & \mathbf{0} & 0 & 0 \\ 0 & 2 & \mathbf{0} & \mathbf{2} & \mathbf{0} & 0 \\ \hline 0 & 3 & 0 & 1 & \mathbf{1} & \mathbf{0} \\ 0 & 1 & 1 & 0 & \mathbf{0} & \mathbf{1} \end{pmatrix}$$

The code generated by G_1 is of type (2,3;3,1;2) and the code generated by G_2 is of type (1,5;3,2;1).

 $\begin{array}{c} Motivation\\ Additive \mathbb{Z}_2\mathbb{Z}_4 \ Codes\\ Counting \ codes\\ Summary \end{array} \begin{array}{c} Basic \ Definitions\\ Generator \ Matrix\\ Duality \end{array}$

[3]-[6]

The inner product of two vectors $\bm{u}, \bm{v} \in \mathbb{Z}_2^\alpha \mathbb{Z}_4^\beta$ is defined as follows

$$[\mathbf{u},\mathbf{v}] = 2(\sum_{i=1}^{\alpha} u_i v_i) + \sum_{j=\alpha+1}^{\alpha+\beta} u_j v_j \in \mathbb{Z}_4$$

The additive dual code of C is

$$C^{\perp} = \{ \mathbf{v} \in \mathbb{Z}_2^{lpha} \times \mathbb{Z}_4^{eta} \mid [\mathbf{u}, \mathbf{v}] = 0 \text{ for all } \mathbf{u} \in C \}.$$

Motivation Additive Z₂Z₄ Codes Counting codes Summary

Basic Definitions Generator Matrix Duality

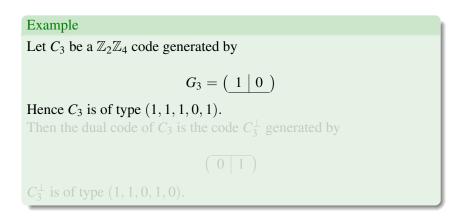

[3]-[6]

If *C* is a $\mathbb{Z}_2\mathbb{Z}_4$ code with type $(\alpha, \beta; \gamma, \delta; \kappa)$, then C^{\perp} is of type $(\alpha, \beta; \overline{\gamma}, \overline{\delta}; \overline{\kappa})$, where

$$\bar{\gamma} = \alpha + \gamma - 2\kappa, \bar{\delta} = \beta - \gamma - \delta + \kappa, \bar{\kappa} = \alpha - \kappa.$$

<ロ> <0</p>

Motivation Additive Z₂Z₄ Codes Counting codes Summary Duality

Example

Let C_3 be a $\mathbb{Z}_2\mathbb{Z}_4$ code generated by

$$G_3 = \left(\begin{array}{c|c} 1 & 0 \end{array} \right)$$

Hence C_3 is of type (1, 1, 1, 0, 1). Then the dual code of C_3 is the code C_3^{\perp} generated by

$$\left(\begin{array}{c|c} 0 & 1 \end{array} \right)$$

 C_3^{\perp} is of type (1, 1, 0, 1, 0).

Counting codes	Counting Free Additive Codes
Summary	Counting Arbitrary Additive Codes

Theorem ([12]) The number of [n, k]-codes over \mathbb{F}_q is given by the following Gaussian coefficient: $\begin{bmatrix} n\\ k \end{bmatrix}_q$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Example

The number of ternary linear codes of length 3 and dimension 1 is 13:

$$\begin{bmatrix} 3\\2 \end{bmatrix}_3 = \frac{(3^3 - 1)(3^{3-1} - 1)}{(3^2 - 1)(2^{2-1} - 1)} = 13.$$

These linear codes are given by the following generator matrices:

$$\left[\begin{array}{rrrr}1 & X & Y\end{array}\right], \left[\begin{array}{rrrr}0 & 1 & X\end{array}\right], \left[\begin{array}{rrrr}0 & 0 & 1\end{array}\right]$$

where $X, Y \in \mathbb{Z}_3$.

Example

The number of ternary linear codes of length 3 and dimension 1 is 13:

$$\begin{bmatrix} 3\\2 \end{bmatrix}_3 = \frac{(3^3 - 1)(3^{3-1} - 1)}{(3^2 - 1)(2^{2-1} - 1)} = 13.$$

These linear codes are given by the following generator matrices:

$$\left[\begin{array}{rrrr}1 & X & Y\end{array}\right], \left[\begin{array}{rrrr}0 & 1 & X\end{array}\right], \left[\begin{array}{rrrr}0 & 0 & 1\end{array}\right]$$

where $X, Y \in \mathbb{Z}_3$.

3 Counting codes

Counting Codes over Finite Fields

• Counting Codes Over Finite Chain Rings

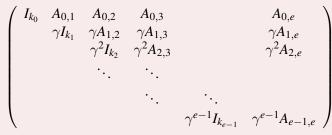

- Counting Free Additive Codes
- Counting Arbitrary Additive Codes

Definition

- A ring R is a local ring if it has a unique maximal ideal m. This maximal ideal contains all non-units of the ring.
- A principal ideal ring is a ring such that every ideal is generated by a single element.
- A principal ideal ring where the ideals are linearly ordered is called a chain ring.

Theorem

Every code over a finite chain ring has a generator matrix that is permutation equivalent to a matrix of the following form

where $A_{i,j}$ are matrices with elements in a finite chain ring and e is the nilpotency index of γ .

A code with this generator matrix is said to be of type $(k_0, k_1, \dots, k_{e-1})$.

Theorem

Every code over a finite chain ring has a generator matrix that is permutation equivalent to a matrix of the following form

where $A_{i,j}$ are matrices with elements in a finite chain ring and e is the nilpotency index of γ .

A code with this generator matrix is said to be of type $(k_0, k_1, \cdots, k_{e-1})$.

Theorem ([11], Dougherty and Saltürk)

Let *R* be a chain ring with maximal ideal $\langle \gamma \rangle$, where γ has nilpotency *e*. Then number of distinct codes of type $(k_0, k_1, \dots, k_{e-1})$ is

$$\frac{q^{\sum_{j=0}^{e-2}nk_j(e-(j+1))}\prod_{a=0}^{e-1}\prod_{i=0}^{k_a-1}(q^n-q^{\sum_{b=0}^{a-1}k_b}q^i)}{q^{\sum_{j=0}^{e-2}(e-(j+1))k_j^2+\sum_{a=0}^{e-2}\{(e-(a+1))k_{a+1}\sum_{t=0}^{a}k_t\}+\sum_{r=0}^{e-2}(\sum_{l=r+1}^{e-1}(e^{-l)k_rk_l})}\prod_{i=0}^{e-1}(q^{k_i}-1)(q^{k_i}-q^{k_i-1})}.$$

Theorem ([14], Wan)

Take \mathbb{Z}_4 as a finite chain ring. A linear code over \mathbb{Z}_4 is permutation equivalent to a linear code with the following generator matrix

$$\left(\begin{array}{ccc} I_{k_0} & A_{11} & A_{12} \\ 0 & 2I_{k_1} & 2A_{22} \end{array}\right)$$

where A_{ij} are matrices over \mathbb{Z}_4 .

Corollary ([11], Dougherty and Saltürk)

The number of distinct linear codes of type (k_0, k_1) over \mathbb{Z}_4 is

$$\frac{2^{nk_0}\prod_{i=0}^{k_0-1}(2^n-2^i)\prod_{j=0}^{k_1-1}(2^n-2^{k_0+j})}{2^{k_0^2+2k_0k_1}\prod_{i=0}^{k_0-1}(2^{k_0}-2^i)\prod_{l=0}^{k_1-1}(2^{k_0}-2^l)}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

33/66

Theorem ([14], Wan)

Take \mathbb{Z}_4 as a finite chain ring. A linear code over \mathbb{Z}_4 is permutation equivalent to a linear code with the following generator matrix

$$\left(\begin{array}{ccc} I_{k_0} & A_{11} & A_{12} \\ 0 & 2I_{k_1} & 2A_{22} \end{array}\right)$$

where A_{ij} are matrices over \mathbb{Z}_4 .

Corollary ([11], Dougherty and Saltürk)

The number of distinct linear codes of type (k_0, k_1) over \mathbb{Z}_4 is

$$\frac{2^{nk_0}\prod_{i=0}^{k_0-1}(2^n-2^i)\prod_{j=0}^{k_1-1}(2^n-2^{k_0+j})}{2^{k_0^2+2k_0k_1}\prod_{t=0}^{k_0-1}(2^{k_0}-2^t)\prod_{l=0}^{k_1-1}(2^{k_0}-2^t)}$$

Motivation	Counting Codes over Finite Fields
Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes	Counting Codes Over Finite Chain Rings
Counting codes	Counting Free Additive Codes
Summary	Counting Arbitrary Additive Codes

The number of distinct linear codes of type (1,3) and length 4 over \mathbb{Z}_4 is 15 since

$$\frac{2^4(2^4-1)(2^4-2)(2^4-2^2)(2^4-2^3)}{2^7(2^1-1)(2^3-1)(2^3-2)(2^4-2^2)} = 15.$$

Example (cont.)

The generator matrices of those codes are as follows

$$\begin{bmatrix} 1 & X & Y & Z \\ 0 & 2 & 0 & 0 \\ 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & 2 \end{bmatrix}, \begin{bmatrix} 2 & 0 & 0 & 0 \\ 0 & 1 & X & Y \\ 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & 2 \end{bmatrix}, \begin{bmatrix} 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 2 \end{bmatrix}, \begin{bmatrix} 2 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 2 \end{bmatrix}, \begin{bmatrix} 2 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

where $X, Y, Z \in \mathbb{Z}_2$.

Theorem

$$\left\{ \begin{array}{c} \alpha, \beta \\ \gamma, \delta, \kappa \end{array} \right\} = 2^{\beta - \gamma - \delta + \kappa} \left\{ \begin{array}{c} \alpha - 1, \beta \\ \gamma - 1, \delta, \kappa - 1 \end{array} \right\} + 2^{\delta + \kappa} \left\{ \begin{array}{c} \alpha - 1, \beta \\ \gamma, \delta, \kappa \end{array} \right\}.$$

Theorem

$$\left\{\begin{array}{c} \alpha, \beta\\ \gamma, \delta, \kappa\end{array}\right\} = 2^{\alpha+\beta-\gamma-\delta} \left\{\begin{array}{c} \alpha-1, \beta\\ \gamma-1, \delta, \kappa-1\end{array}\right\} + 2^{\delta} \left\{\begin{array}{c} \alpha-1, \beta\\ \gamma, \delta, \kappa\end{array}\right\}.$$

Motivation	Counting Codes over Finite Fields
Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes	Counting Codes Over Finite Chain Rings
Counting codes	Counting Free Additive Codes
Summary	Counting Arbitrary Additive Codes

Corollary ([13], Dougherty and Saltürk)

The number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type $(\alpha, \beta; \gamma, \delta; \kappa)$ is equal to the number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type $(\alpha, \beta; \alpha + \gamma - 2\kappa, \beta - \gamma - \delta + \kappa; \alpha - \kappa).$

Example

Since the number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type (2, 2; 2, 0; 1) is 18 from the previous example, we consider codes of type (2, 2; 2, 1; 1) where $\bar{\gamma} = 2 + 2 - 2 = 2$, $\bar{\delta} = 2 - 2 - 0 + 1 = 1$, $\bar{\kappa} = 2 - 1 = 1$. The parameters above are the parameters of the dual codes. Then we have the number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type (2, 2; 2, 1; 1) from the formula which is the same as the number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type (2, 2; 2, 0; 1).

Motivation Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes	Counting Codes over Finite Fields Counting Codes Over Finite Chain Rings
Counting codes	Counting Free Additive Codes
Summary	Counting Arbitrary Additive Codes

Since the number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type (2, 2; 2, 0; 1) is 18 from the previous example, we consider codes of type (2, 2; 2, 1; 1) where $\bar{\gamma} = 2 + 2 - 2 = 2$, $\bar{\delta} = 2 - 2 - 0 + 1 = 1$, $\bar{\kappa} = 2 - 1 = 1$. The parameters above are the parameters of the dual codes. Then we have the number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type (2, 2; 2, 1; 1) from the formula which is the same as the number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type (2, 2; 2, 0; 1).

Decomposable codes

Lemma ([13], Dougherty and Saltürk)

A decomposable $\mathbb{Z}_2\mathbb{Z}_4$ code of type $(\alpha, \beta; \gamma, \delta; \kappa)$ is the direct product of a binary code of dimension κ in an α dimensional space and a quaternary code in \mathbb{Z}_4^β of quaternary type $(\delta, \gamma - \kappa)$.

Lemma ([13], Dougherty and Saltürk)

The number of decomposable codes of type $(\alpha, \beta; \gamma, \delta; \kappa)$ is

$$\left(\begin{bmatrix} \alpha \\ \kappa \end{bmatrix}_{2} \right) \left(\frac{2^{\beta k_{0}} \prod_{a=0}^{1} \prod_{i=0}^{k_{a}-1} (2^{\beta} - 2^{\sum_{b=0}^{a-1} k_{b}} 2^{i})}{2^{k_{0}^{2} + 2k_{0}k_{1}} \prod_{i=0}^{1} (2^{k_{i}} - 1)(2^{k_{i}} - 2) \dots (2^{k_{i}} - 2^{k_{i}-1})} \right)$$

where $k_0 = \delta$, $k_1 = \gamma - \kappa$.

Motivation Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes Counting codes Summary Counting Codes over Finite Fields Counting Codes Over Finite Chain Rings Counting Free Additive Codes Counting Arbitrary Additive Codes

Indecomposable codes

Theorem ([13], Dougherty and Saltürk)

The number of indecomposable codes of type $(\alpha, \beta; \gamma, \delta; \kappa)$ is

$$2^{(\alpha+\beta-2\gamma-\delta)\delta+\beta\kappa} \begin{bmatrix} \beta \\ \delta \end{bmatrix}_2 \begin{bmatrix} \alpha \\ \kappa \end{bmatrix}_2 \begin{bmatrix} \beta-\delta \\ \gamma-\kappa \end{bmatrix}_2$$
$$- (\begin{bmatrix} \alpha \\ \kappa \end{bmatrix}_2) (\frac{2^{\beta k_0} \prod_{a=0}^{1} \prod_{i=0}^{k_a-1} (2^{\beta}-2\sum_{b=0}^{a-1} k_b 2^i)}{2^{k_0^2+2k_0k_1} \prod_{i=0}^{1} (2^{k_i}-1)(2^{k_i}-2) \dots (2^{k_i}-2^{k_i-1})}),$$
where $k_0 = \delta$, $k_1 = \gamma - \kappa$.

Motivation	Counting Codes over Finite Fields
Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes	Counting Codes Over Finite Chain Rings
Counting codes	Counting Free Additive Codes
Summary	Counting Arbitrary Additive Codes

The number of $\mathbb{Z}_2\mathbb{Z}_4$ codes of type (2, 2; 2, 0; 1) is 18. The number of decomposable codes of type (2, 2; 2, 0; 1) is 9. Because the number of binary codes of dimension $\kappa = 1$ is $\begin{bmatrix} \alpha \\ \kappa \end{bmatrix}_2 = \begin{bmatrix} 2 \\ 1 \end{bmatrix}_2 = 3$, and the number of quaternary codes in \mathbb{Z}_4^2 of quaternary type $(\delta, \gamma - \kappa) = (0, 1)$ is 3. Then the product, $3 \times 3 = 9$, gives the number of decomposable codes.

Motivation	Counting Codes over Finite Fields
Additive $\mathbb{Z}_2\mathbb{Z}_4$ Codes	Counting Codes Over Finite Chain Rings
Counting codes	Counting Free Additive Codes
Summary	Counting Arbitrary Additive Codes

Example (cont. example)

These codes are generated by the following matrices:

$$\begin{pmatrix} 1 & X & 0 & 0 \\ 0 & 0 & Y & 2 \\ \hline \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & Y & 2 \\ \end{pmatrix}, \begin{pmatrix} 1 & X & 0 & 0 \\ 0 & 0 & 2 & 0 \\ \hline \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & Y & 2 \\ \end{pmatrix}, \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 2 & 0 \\ \end{pmatrix},$$

where $X \in \{0, 1\}$ and $Y \in \{0, 2\}$. The remaining 9 codes are indecomposable ones.
