## A wonderful paper

#### Theorem

Let F be a contravariant functor from the category of rings to the category Top whose restriction to the full subcategory of commutative rings is naturally isomorphic to the functor Spec. Then F assigns the empty topological space to the rings of matrices  $\mathbb{M}_n(R)$  for any ring R and any integer  $n \geq 3$ .

## A wonderful paper

#### Theorem

Let F be a contravariant functor from the category of rings to the category Top whose restriction to the full subcategory of commutative rings is naturally isomorphic to the functor Spec. Then F assigns the empty topological space to the rings of matrices  $\mathbb{M}_n(R)$  for any ring R and any integer  $n \geq 3$ .

#### Corollary

Let G: Rings  $\rightarrow$  CommRings be a covariant functor from the category Rings of rings to the category CommRings of commutative rings whose restriction to the full subcategory of commutative rings is naturally isomorphic to the identity functor CommRings  $\rightarrow$  CommRings. Then G assigns the zero ring to the rings of matrices  $\mathbb{M}_n(R)$  for any ring R and any integer  $n \geq 3$ .

#### The correct setting: lattices

A multiplicative lattice is a complete lattice L equipped with a multiplication satisfying  $xy \le x \land y$  for all  $x, y \in L$ .

### The correct setting: lattices

A multiplicative lattice is a complete lattice L equipped with a multiplication satisfying  $xy \le x \land y$  for all  $x, y \in L$ .

(No associativity, commutativity, identities, distributivity required.)

#### The correct setting: lattices

A multiplicative lattice is a complete lattice L equipped with a multiplication satisfying  $xy \le x \land y$  for all  $x, y \in L$ .

(No associativity, commutativity, identities, distributivity required.)

In all the previous examples, there is a multiplicative lattice around: For commutative rings: the lattice of its ideal with multiplication of ideals.

For noncommutative rings: the lattice of its two-sided ideal with multiplication of ideals, or IJ + JI as a product, if you prefer. For groups: the modular lattice of its normal subgroups with commutator of two normal subgroups.

For lattices: the lattice itself with multiplication  $xy := x \land y$ .

## **Multiplicative lattices**

Multiplicative lattice are an algebraic structure to which little attention has been devoted, but which already appear in Krull (1924!), and has been studied by M. Ward (1937), Ward and R.P. Dilworth (1937), D.D. Anderson (1974), E.W. Johnson, and J.A. Johnson (1970), Hofmann and Keimel (1978), quantales, frames, locales, ...

Multiplicative lattice are an algebraic structure to which little attention has been devoted, but which already appear in Krull (1924!), and has been studied by M. Ward (1937), Ward and R.P. Dilworth (1937), D.D. Anderson (1974), E.W. Johnson, and J.A. Johnson (1970), Hofmann and Keimel (1978), quantales, frames, locales, ...

In all these papers, further axioms are required: associativity or commutativity of multiplication, distributivity with  $\lor$ , identity, compatibility of multiplication and partial order, the multiplication is the meet, ...

## A multiplicative lattice L

For the rest of the talk, L will always be a complete multiplicative lattice, with 0 and 1.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

For the rest of the talk, L will always be a complete multiplicative lattice, with 0 and 1.

An element  $p \neq 1$  is said to be *prime* if it satisfies the implication

$$xy \leq p \Rightarrow (x \leq p \text{ or } y \leq p).$$

Let Spec(L) be the set of all prime elements of L.

We have a mapping

$$V: L \to \mathcal{P}(\operatorname{Spec}(L))$$
  
$$V: x \mapsto V(x) := \{ p \in \operatorname{Spec}(L) \mid x \le p \}.$$

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

We have a mapping

$$V: L \to \mathcal{P}(\operatorname{Spec}(L))$$
  
$$V: x \mapsto V(x) := \{ p \in \operatorname{Spec}(L) \mid x \le p \}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

The mapping  $V: L \rightarrow \mathcal{P}(\text{Spec}(L))$  has the following properties:

(1) V transforms the multiplication in L into the union in  $\mathcal{P}(\operatorname{Spec}(L))$ , that is, V is a magma morphism of the magma  $(L, \cdot)$  into the magma (the commutative monoid)  $(\mathcal{P}(\operatorname{Spec}(L)), \cup)$ :

 $V(xy) = V(x) \cup V(y)$  for every  $x, y \in L$ .

(1) V transforms the multiplication in L into the union in  $\mathcal{P}(\operatorname{Spec}(L))$ , that is, V is a magma morphism of the magma  $(L, \cdot)$  into the magma (the commutative monoid)  $(\mathcal{P}(\operatorname{Spec}(L)), \cup)$ :

$$V(xy) = V(x) \cup V(y)$$
 for every  $x, y \in L$ .

(2) V transforms the  $\lor$  in L into the intersection in  $\mathcal{P}(\text{Spec}(L))$ (more is true: it transforms an arbitrary  $\bigvee$  in L into an arbitrary intersection in  $\mathcal{P}(\text{Spec}(L))$ , even in the infinite case):

$$V(\bigvee_{i\in I} x_i) = \bigcap_{i\in I} V(x_i)$$
 for every subset  $\{x_i \mid i \in I\} \subseteq L$ .

(1) V transforms the multiplication in L into the union in  $\mathcal{P}(\operatorname{Spec}(L))$ , that is, V is a magma morphism of the magma  $(L, \cdot)$  into the magma (the commutative monoid)  $(\mathcal{P}(\operatorname{Spec}(L)), \cup)$ :

$$V(xy) = V(x) \cup V(y)$$
 for every  $x, y \in L$ .

(2) V transforms the  $\lor$  in L into the intersection in  $\mathcal{P}(\text{Spec}(L))$ (more is true: it transforms an arbitrary  $\bigvee$  in L into an arbitrary intersection in  $\mathcal{P}(\text{Spec}(L))$ , even in the infinite case):

$$V(\bigvee_{i\in I} x_i) = \bigcap_{i\in I} V(x_i)$$
 for every subset  $\{x_i \mid i \in I\} \subseteq L$ .

(3) The image V(L) of the mapping V satisfies the axioms for the closed sets of a topology on Spec(L).

(1) V transforms the multiplication in L into the union in  $\mathcal{P}(\operatorname{Spec}(L))$ , that is, V is a magma morphism of the magma  $(L, \cdot)$  into the magma (the commutative monoid)  $(\mathcal{P}(\operatorname{Spec}(L)), \cup)$ :

$$V(xy) = V(x) \cup V(y)$$
 for every  $x, y \in L$ .

(2) V transforms the  $\lor$  in L into the intersection in  $\mathcal{P}(\text{Spec}(L))$ (more is true: it transforms an arbitrary  $\bigvee$  in L into an arbitrary intersection in  $\mathcal{P}(\text{Spec}(L))$ , even in the infinite case):

$$V(\bigvee_{i\in I} x_i) = \bigcap_{i\in I} V(x_i)$$
 for every subset  $\{x_i \mid i \in I\} \subseteq L$ .

(3) The image V(L) of the mapping V satisfies the axioms for the closed sets of a topology on Spec(L).

Spec(L) with this topology is called the Zariski spectrum of L.

#### Always a sober space

Lemma Spec(L) is a sober space.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

A topological space X is said to be *irreducible* if  $X \neq \emptyset$  and  $A \cup B \subset X$  for every pair A, B of proper closed subsets of X.

A topological space X is said to be *irreducible* if  $X \neq \emptyset$  and  $A \cup B \subset X$  for every pair A, B of proper closed subsets of X.

(1) If  $f: X \to Y$  is continuous and  $E \subseteq X$  is an irreducible subset, then  $f(X) \subseteq Y$  is also irreducible.

A topological space X is said to be *irreducible* if  $X \neq \emptyset$  and  $A \cup B \subset X$  for every pair A, B of proper closed subsets of X.

(1) If f: X → Y is continuous and E ⊆ X is an irreducible subset, then f(X) ⊆ Y is also irreducible.
(2) If E ⊆ X is an irreducible subset, so is its closure E in X.

A topological space X is said to be *irreducible* if  $X \neq \emptyset$  and  $A \cup B \subset X$  for every pair A, B of proper closed subsets of X.

(1) If f: X → Y is continuous and E ⊆ X is an irreducible subset, then f(X) ⊆ Y is also irreducible.
 (2) If E ⊆ X is an irreducible subset, so is its closure E in X. In particular, for every x ∈ X, then the closure {x} is an irreducible closed subset of X.

A topological space X is said to be *irreducible* if  $X \neq \emptyset$  and  $A \cup B \subset X$  for every pair A, B of proper closed subsets of X.

(1) If f: X → Y is continuous and E ⊆ X is an irreducible subset, then f(X) ⊆ Y is also irreducible.
 (2) If E ⊆ X is an irreducible subset, so is its closure E in X. In particular, for every x ∈ X, then the closure {x} is an irreducible closed subset of X.

In general, if  $E \subseteq X$  is an irreducible closed subset, a point  $x \in E$  such that  $E = \overline{\{x\}}$  is called a *generic point* of E.

A topological space X is said to be *irreducible* if  $X \neq \emptyset$  and  $A \cup B \subset X$  for every pair A, B of proper closed subsets of X.

(1) If f: X → Y is continuous and E ⊆ X is an irreducible subset, then f(X) ⊆ Y is also irreducible.
(2) If E ⊆ X is an irreducible subset, so is its closure E in X. In particular, for every x ∈ X, then the closure {x} is an irreducible closed subset of X.

In general, if  $E \subseteq X$  is an irreducible closed subset, a point  $x \in E$  such that  $E = \overline{\{x\}}$  is called a *generic point* of E.

In the complete lattice of closed subsets of a topological space X, irreducible closed subsets are exactly the join-irreducible elements of the lattice.

#### Sober spaces

For every topological space X, there is a map  $x \mapsto \{x\}$  from X to the set of irreducible closed subsets of X. This map is injective if and only if X is  $T_0$ .

#### Sober spaces

For every topological space X, there is a map  $x \mapsto \{x\}$  from X to the set of irreducible closed subsets of X. This map is injective if and only if X is  $T_0$ . By definition, X is *sober* if this map is a bijection.

For example,  $\operatorname{Spec}(R)$  is sober: its irreducible closed subsets are the subsets  $V(\mathfrak{p})$  with  $\mathfrak{p}$  a prime ideal of R, that is, the closures  $V(\mathfrak{p})$  of the points  $\mathfrak{p}$  of  $\operatorname{Spec}(R)$ .

What is the advantage of working with sober spaces?

#### Sober spaces

For every topological space X, there is a map  $x \mapsto \{x\}$  from X to the set of irreducible closed subsets of X. This map is injective if and only if X is  $T_0$ . By definition, X is *sober* if this map is a bijection.

For example,  $\operatorname{Spec}(R)$  is sober: its irreducible closed subsets are the subsets  $V(\mathfrak{p})$  with  $\mathfrak{p}$  a prime ideal of R, that is, the closures  $V(\mathfrak{p})$  of the points  $\mathfrak{p}$  of  $\operatorname{Spec}(R)$ .

What is the advantage of working with sober spaces?

It is that, in some sense, sober spaces are (bounded distributive) lattices, in the sense that the lattice  $\Omega(X)$  of open subsets of a sober space X completely determines the underlying set X.
Objects: our multiplicative lattices. Morphisms?

Objects: our multiplicative lattices. Morphisms?

Our multiplicative lattices are complete lattices, but it is better not to consider them complete lattices, but complete join-semilattices.

Objects: our multiplicative lattices. Morphisms?

Our multiplicative lattices are complete lattices, but it is better not to consider them complete lattices, but complete join-semilattices. What is the difference between complete lattices and complete join-semilattices?

・ロト・日本・モート モー うへぐ

Objects: our multiplicative lattices. Morphisms?

Our multiplicative lattices are complete lattices, but it is better not to consider them complete lattices, but complete join-semilattices. What is the difference between complete lattices and complete join-semilattices? None. They are exactly the same thing.

Objects: our multiplicative lattices. Morphisms?

Our multiplicative lattices are complete lattices, but it is better not to consider them complete lattices, but complete join-semilattices. What is the difference between complete lattices and complete join-semilattices? None. They are exactly the same thing. But morphisms are different: if L and M are complete lattices, their morphisms as lattices are the mappings  $f: L \to M$  such that  $f(x \lor x') = f(x) \lor f(x')$  and  $f(x \land x') = f(x) \land f(x')$  for every  $x, x' \in L$ ,

Objects: our multiplicative lattices. Morphisms?

Our multiplicative lattices are complete lattices, but it is better not to consider them complete lattices, but complete join-semilattices. What is the difference between complete lattices and complete join-semilattices? None. They are exactly the same thing. But morphisms are different: if L and M are complete lattices, their morphisms as lattices are the mappings  $f: L \to M$  such that  $f(x \lor x') = f(x) \lor f(x')$  and  $f(x \land x') = f(x) \land f(x')$  for every  $x, x' \in L$ , and those as complete join-semilattices are the mappings  $f: L \to M$  such that  $f(\bigvee X) = \bigvee f(X)$  for every subset  $X \subseteq L$ .

Objects: our multiplicative lattices. Morphisms?

Our multiplicative lattices are complete lattices, but it is better not to consider them complete lattices, but complete join-semilattices. What is the difference between complete lattices and complete join-semilattices? None. They are exactly the same thing. But morphisms are different: if L and M are complete lattices, their morphisms as lattices are the mappings  $f: L \to M$  such that  $f(x \lor x') = f(x) \lor f(x')$  and  $f(x \land x') = f(x) \land f(x')$  for every  $x, x' \in L$ , and those as complete join-semilattices are the mappings  $f: L \to M$  such that  $f(\bigvee X) = \bigvee f(X)$  for every subset  $X \subseteq L$ .

The category of complete join-semilattice is a nice symmetric monoidal closed category.

Let L and M be partially ordered sets.

Let L and M be partially ordered sets. Consider all monotone Galois connections  $(f, u): L \to M$ ,

Let L and M be partially ordered sets. Consider all monotone Galois connections  $(f, u): L \to M$ , that is, pairs of partially ordered set morphisms  $f: L \to M$ ,  $u: M \to L$ , with  $f(x) \le y \Leftrightarrow x \le u(y)$ for all  $x \in L$  and  $y \in M$ .

Let L and M be partially ordered sets. Consider all *monotone* Galois connections  $(f, u): L \to M$ , that is, pairs of partially ordered set morphisms  $f: L \to M$ ,  $u: M \to L$ , with  $f(x) \le y \Leftrightarrow x \le u(y)$ for all  $x \in L$  and  $y \in M$ . (Considering L and M as categories, a monotone Galois connection is exactly a pair of adjoint functors).

Let L and M be partially ordered sets. Consider all monotone Galois connections  $(f, u): L \to M$ , that is, pairs of partially ordered set morphisms  $f: L \to M$ ,  $u: M \to L$ , with  $f(x) \le y \Leftrightarrow x \le u(y)$ for all  $x \in L$  and  $y \in M$ . (Considering L and M as categories, a monotone Galois connection is exactly a pair of adjoint functors).

In particular, for L and M complete lattices: (1) f preserves arbitrary joins, and, conversely, for any join preserving map  $f: L \to M$  there exists a unique map  $u: M \to L$ such that  $(f, u): L \to M$  is a monotone Galois connection;

Let L and M be partially ordered sets. Consider all monotone Galois connections  $(f, u): L \to M$ , that is, pairs of partially ordered set morphisms  $f: L \to M$ ,  $u: M \to L$ , with  $f(x) \le y \Leftrightarrow x \le u(y)$ for all  $x \in L$  and  $y \in M$ . (Considering L and M as categories, a monotone Galois connection is exactly a pair of adjoint functors).

In particular, for L and M complete lattices:

(1) f preserves arbitrary joins, and, conversely, for any join preserving map  $f: L \to M$  there exists a unique map  $u: M \to L$  such that  $(f, u): L \to M$  is a monotone Galois connection; (2) u preserves arbitrary meets, and, conversely, for any meet preserving map  $u: M \to L$  there exists a unique map  $f: L \to M$  such that  $(f, u): L \to M$  is a monotone Galois connection.

In the category MCL, whose objects are our complete multiplicative lattices  $(L, \cdot)$ , morphisms  $L \to M$  are monotone Galois connections  $(f, u) \colon L \to M$  such that  $f(x)f(x') \leq f(xx')$  for every  $x, x' \in L$ . (Hence, morphisms in MCL = morphisms in the category of complete join-semilattices such that  $f(x)f(x') \leq f(xx')$ for every  $x, x' \in L$ .)

In the category MCL, whose objects are our complete multiplicative lattices  $(L, \cdot)$ , morphisms  $L \to M$  are monotone Galois connections  $(f, u): L \to M$  such that  $f(x)f(x') \leq f(xx')$  for every  $x, x' \in L$ . (Hence, morphisms in MCL = morphisms in the category of complete join-semilattices such that  $f(x)f(x') \leq f(xx')$ for every  $x, x' \in L$ .)

Composition in MCL is defined by  $(f', u') \circ (f, u) = (f' \circ f, u \circ u')$ for every pair of morphisms  $(f, u) \colon L \to L'$  and  $(f', u') \colon L' \to L''$ .

Proposition

There is a contravariant functor  $\operatorname{Spec}\colon\mathsf{MCL}\to\mathsf{Top}.$ 

### Proposition

There is a contravariant functor  $\operatorname{Spec}\colon\mathsf{MCL}\to\mathsf{Top}.$ 

(For every morphism  $(f, u): L \to L'$ , one proves that  $u(\operatorname{Spec}(M)) \subseteq \operatorname{Spec}(L)$ , and the restriction of  $u: M \to L$  to  $\operatorname{Spec}(M) \to \operatorname{Spec}(L)$  is continuous.)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

## Proposition

There is a contravariant functor  $\operatorname{Spec}\colon\mathsf{MCL}\to\mathsf{Top}.$ 

(For every morphism  $(f, u): L \to L'$ , one proves that  $u(\operatorname{Spec}(M)) \subseteq \operatorname{Spec}(L)$ , and the restriction of  $u: M \to L$  to  $\operatorname{Spec}(M) \to \operatorname{Spec}(L)$  is continuous.)

### Proposition

There is a covariant functor CommRings  $\rightarrow$  MCL that associates to every commutative ring R with identity the multiplicative lattice  $\mathcal{L}(R)$  of its ideals.

## Proposition

There is a contravariant functor  $\operatorname{Spec}\colon\mathsf{MCL}\to\mathsf{Top}.$ 

(For every morphism  $(f, u) \colon L \to L'$ , one proves that  $u(\operatorname{Spec}(M)) \subseteq \operatorname{Spec}(L)$ , and the restriction of  $u \colon M \to L$  to  $\operatorname{Spec}(M) \to \operatorname{Spec}(L)$  is continuous.)

### Proposition

There is a covariant functor CommRings  $\rightarrow$  MCL that associates to every commutative ring R with identity the multiplicative lattice  $\mathcal{L}(R)$  of its ideals.

Clearly, the composite functor of the two functors

 $\mathsf{CommRings} \to \mathsf{MCL} \quad \mathrm{and} \quad \mathrm{Spec} \colon \mathsf{MCL} \to \mathsf{Top}$ 

is the usual contravariant functor Spec from the category of commutative rings with identity to the category Top of topological spaces.

The functor Spec:  $MCL^{OP} \rightarrow \{\text{sober spaces}\}\)$  is a right adjoint of the functor  $\{\text{sober spaces}\} \rightarrow MCL^{OP}$ , that maps any sober space X to the complete lattice  $\Omega(X)$  of its open subsets, with multiplication the intersection:  $xy = x \land y$  for every  $x, y \in \Omega(X)$ .

"I don't like those multiplicative lattices. Arent' lattices sufficient? You just call an element p of a lattice L prime if  $x \land y \le p \Rightarrow (x \le p \text{ or } y \le p)$ ." Ok, by this doesn't even cover the first original examples of commutative rings with identity. If you take a DVR, with this definition of prime, all proper ideals of Rwould be prime, not only 0 and the maximal ideal of R as we want! Spectrum of a bounded distributive lattice

Let D be a bounded distributive lattice, and let X := Spec(D) denote the set of prime ideals of D.

### Spectrum of a bounded distributive lattice

Let D be a bounded distributive lattice, and let X := Spec(D) denote the set of prime ideals of D. There is a duality

 $Spec: \{ \mathsf{bounded \ distributive \ lattices} \} \rightarrow \{ \mathsf{topol. \ spectral \ spaces} \}!$ 

### Spectrum of a bounded distributive lattice

Let D be a bounded distributive lattice, and let X := Spec(D) denote the set of prime ideals of D. There is a duality

 $\operatorname{Spec} \colon \{ \text{bounded distributive lattices} \} \to \{ \text{topol. spectral spaces} \}!$ 

Its inverse is

 $\mathcal{K}^{\circ}(-)$ : {topol. spectral spaces}  $\rightarrow$  {bounded distributive lattices},

 $X \mapsto K^{\circ}(X).$ 

### Conclusions. Solution of our problem

To develop the standard properties of the Zariski spectrum of any algebraic structure

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

### Conclusions. Solution of our problem

To develop the standard properties of the Zariski spectrum of any algebraic structure

Input: a multiplicative lattice.

### Conclusions. Solution of our problem

To develop the standard properties of the Zariski spectrum of any algebraic structure

Input: a multiplicative lattice.

Output: a bounded distributive lattice. Their category is equivalent to the category of spectral spaces.
